Student-t with strata

Parametrization

This model is an extention to the Student-t, where different strata have their own precisions but the degrees-of-freedom parameter is common.

The Student-t likelihood is defined so that

$$\sqrt{w \ \tau_s}(y-\eta) \sim T_{\nu}$$

for continuous response y where

 au_s : is the precision parameter, depending on the stratum s

w: is a fixed weight w > 0

 η : is the linear predictor

 T_{ν} : is a standardized Student-t with ν degrees of freedom such that its variace is 1 for any value of ν , common for all strata.

Identity

Hyperparameters

This likelihood $N_s + 1$ hyperparameters

$$\theta_1 = \log(\nu - 2)$$

$$\theta_2 = \log(\tau_1)$$

$$\theta_3 = \log(\tau_2)$$

$$etc....$$

$$\theta_{N_s+1} = \log(\tau_{N_s})$$

where N_s is the number of strata defined. The current implementation limits N_s to 10, but this is easy to fix if needed. The prior is defined on $\theta = (\theta_1, \theta_2, ...)$.

Specification

- family = tstrata
- Required argument: y and w (keyword weights, default to 1), and inla()-argument "strata" which is either a integer vector with elements $1, 2, ..., N_s$, or factor for which the levels defines the strata.

Hyperparameter spesification and default values
