# Autoregressive model of order 1 (AR1)

#### Parametrization

The autoregressive model of order 1 (AR1) for the Gaussian vector  $\mathbf{x} = (x_1, \dots, x_n)$  is defined as:

$$x_1 \sim \mathcal{N}(0, (\tau(1-\rho^2))^{-1})$$
  
 $x_i = \rho x_{i-1} + \epsilon_i; \quad \epsilon_i \sim \mathcal{N}(0, \tau^{-1}) \quad i = 2, \dots, n$ 

where

$$|\rho| < 1$$

## Hyperparameters

The precision parameter  $\kappa$  is represented as

$$\theta_1 = \log(\kappa)$$

where  $\kappa$  is the marginal precision,

$$\kappa = \tau (1 - \rho^2).$$

The parameter  $\rho$  is represented as

$$\theta_2 = \log\left(\frac{1+\rho}{1-\rho}\right)$$

and the prior is defined on  $\theta = (\theta_1, \theta_2)$ .

### Specification

The AR1 model is specified inside the f() function as

```
f(<whatever>, model="ar1", values=<values>, hyper = <hyper>)
```

The (optional) argument values is a numeric or factor vector giving the values assumed by the covariate for which we want the effect to be estimated. See the example for RW1 for an application.

#### Hyperparameter spesification and default values

**doc** Auto-regressive model of order 1 (AR(1))

#### hyper

```
theta1

pdf ar1
Example
In this exaple we implement an ar1 model observed with Poisson counts
#simulate data
n = 100
rho = 0.8
prec = 10
## note that the marginal precision would be
marg.prec = prec * (1-rho^2)
E=sample(c(5,4,10,12),size=n,replace=T)
eta = as.vector(arima.sim(list(order = c(1,0,0), ar = rho), n = n,sd=sqrt(1/prec)))
y=rpois(n,E*exp(eta))
data = list(y=y, z=1:n, E=E)
```

```
## fit the model
formula = y~f(z,model="ar1")
result = inla(formula,family="poisson", data = data, E=E)
```

## Notes

A third hyperparameter  $\theta_3$  is **experimental**, and the *mean* of the AR1 process. By default this parameter is fixed to the be zero.
